

OPENING REMARKS FROM ISHCCO PRESIDENT

WELCOME FROM MARK SNELLING APS PRESIDENT

EVANGELITSA TSOULOFTA ISHCCO

APS & ISHCCO International Conference 2025 Edinburgh, Friday 14 March 2025

Introduction to ISHCCO

International Safety & Health Construction Co-ordinators Organisation

www.ishcco.org Forum da Vinci, 4-6 Bd. Grande Duchesse Charlotte L-1330 LUXEMBOURG

ISHCCO

ISHCCO International Safety and Health Construction Co-ordinators **O**rganisation

Founded in 2002

European Umbrella Association of Coordinators for Safety and Health Matters

Member Countries – Member Associations

AT: BAUKO, BE: VC-CS, CH: Lobsiger & P. GmbH, CY: CYACE, FPA, DE: VSDI & VSGK, DK: IDA, ES: ASPRECO, FR: OPPBTP, HR: CAHSCC (HUK-ZNR), LU: ACSSL, PT: OET, UK: APS

Representing

60.000 SHCC (Safety and Health Construction Corordinators)

ISHCCO

6

ISHCCO - Organisation

ISHCCO Purpose

Recent Amendment of the Statutes in 2024

 A nonprofit association of national health and safety Coordinators associations in European countries in sense of the European Directive 92/57
 or other entities involved in coordination of safety and health on construction sites.

Opening of ISHCCO purpose

- Purpose beyond European Directive 92/57
- ✓ More members
- Possibility to expand beyond European Boarders

VISION ZEROCO

Enhance SHCC's role & Promote SHCC's Professional Qualifications

- Affirm the professional identity
- Recognize and defend the professionalization
- Ensure the professional qualifications
- Safeguard and promote the professional interests
- Assert the status, role and responsibility

Represent SHCC in Europe & Worldwide

- Represent National Members
- Speak with a single voice
- Promote excellence in the education, training and professional development
- Exchange of information and to support a wider dissemination
- Support multilateral collaboration

VISION ZEROCO

ISHCCO Vision

Vision

Our vision for ISHCCO is to affirm our members' professional identity and collaborate with occupational safety and health (OSH) and construction professionals and institutions for a safer, healthier and sustainable construction industry and infrastructure.

ISHCCO Priorities

1	Promote the role of ISHCCO and Safety and Health Construction Coordinators in Construction OSH
\bigvee	
2	Regulation of Safety and Health Construction Coordinators' Qualifications
3	Enhancing Awareness and Education – Promotion of Prevention Culture
\backslash	
4	Better construction OSH Regulation

1. Enhancing existing and Building New Partnerships

2. Enhancing communication with members, partners, and friends

ISHCCO Strategic Partnerships

- o EU-OSHA
- Social partners EFBWW & FIEC

MoU with:

• ECCE

(AECEF)

- ISSA-Construction
- O ORP ORP INTERNATIONAL FOUNDATION

Ο

ISHCCO

Qualification Framework (IQF)

Based on European Qualification
 Framework (EQF)

ISHCCO

- Required Knowledge & Skills,
 Responsibility and autonomy (duties & examples of projects for each level 5, 6, 7 / preparation & execution stages)
- Amendment in 2022 to include
 Vision Zero Strategy and SDGs
 (Sustainable Development Goals)

In line with Good Practice of EC
 Non-binding Guide for
 Construction Site Directive

<text><text>

ISHCCO Invitation

Invitation to join ISHCCO

We invite all Members, Partners, Sponsors and Friends of ISHCCO to join us and work together to build a safer, healthier and sustainable future for all !

Acknowledgement

Thank you for your attention !

MARK SNELING APS PRESIDENT

Managing competence to ensure life safety in the Built Environment Preventing a recurrence of the

Preventing a recurrence of the Grenfell Tragedy

© Safetymark Consultancy Services

Presenter

Mark Snelling MCIOB, FaPS, Cert IOSH President of the Association for Project Safety Founder Director of the Building Safety Alliance Health Safety and Fire Adviser to the Property Institute Chartered Builder Certified Member of IOSH Member of BS8670, PAS 8671, PAS 8763 and BS 8674 Committees Technical author of the Building Safety Alliance Organisational Capability Standard Member of Home Office legislation review group

Introduction

On 14 June 2017, a fire broke out at Grenfell Tower, a 24-storey residential tower block in West Kensington, London. Starting on the fourth floor, the fire quickly spread throughout the building and resulted in 72 fatalities.

The Grenfell Tower Enquiry Phase 2 Report was issued in September 2024 and said:

Safety of people in the built environment depends principally on a combination of three primary elements, good design, the choice of suitable materials and sound methods of construction, each of which depends in turn in a large measure on a fourth, the skill, knowledge and experience of those engaged in the construction industry. Unfortunately, as our investigations have shown, at the time of the Grenfell Tower fire there were serious deficiencies in all four of those areas.

Our investigations have shown that levels of competence in the construction industry are generally low.

Grenfell Inquiry Phase 2 Report

The simple truth is that the deaths that occurred were all avoidable and that those who lived in the tower were badly failed over a number of years and in a number of different ways by those who were responsible for ensuring the safety of the building and its occupants. ...all contributed to it in one way or another, in most cases through incompetence but in some cases through dishonesty and greed.

Sir Martin Moore Bick (2024) on the publication of the Grenfell Inquiry Phase 2 Report

Grenfell Inquiry Phase 2 Report

Regulations alone (no matter how good) will not guarantee safe buildings, lead to industry transformation or create the needed culture change.

Grenfell Inquiry Phase 2 Report

... if you work in the construction industry and you do not feel the weight of responsibility you have for for keeping people safe you are in the wrong job.

Dr Thouria Istephan, Grenfell Inquiry Panel, Statement on the publication of the Phase 2 Report, 2024

Managing competence to ensure life safety in the Built Environment Competence before Grenfell

CDM 2015 - Duty to be competent

8.—(1) A designer (including a principal designer) or contractor (including a principal contractor) appointed to work on a project must have:

- the skills, knowledge and experience; and
- if they are an organisation, the organisational capability;

necessary to fulfil the role that they are appointed to undertake, in a manner that secures the health and safety of any person affected by the project.

Organisational capability

Organisational capability means the policies and systems an organisation has in place to set acceptable health and safety standards which comply with the law, and the resources and people to ensure the standards are delivered.

58 Anyone appointing a designer or contractor to work on a project must take reasonable steps to satisfy themselves that those who will carry out the work have the skills, knowledge, experience, and, where they are an organisation, the organisational capability to carry out the work in a way that secures health and safety.

62 When considering the requirements for designers and other construction professionals, due weight should also be given to membership of an established professional institution or body.

For example, do these bodies have arrangements in place which provide some reassurance that health and safety is part of the route to membership of their profession?

However, questions should also be asked of individuals to ensure that they have sufficient skills, knowledge, and experience to carry out the work involved, and that they keep those capabilities up to date.

Managing competence to ensure life safety in the Built Environment Competence after Grenfell

Building Regulation 2010 Competence: general requirement

Any person carrying out any building work or any design work must have—

(a) where the person is an individual, the **skills, knowledge, experience and behaviours** necessary,

(b) where the person is not an individual, the organisational capability,

to carry out:

(i) the building work in accordance with all relevant requirements;

(ii) the design work so that the building work to which the design relates, if built, would be in accordance with all relevant requirements.

Organisational Capability

"organisational capability" means appropriate management policies, procedures, systems and resources to ensure individuals under the control of the organisation:

- who are carrying out any building work or any design work comply with competence: general requirement;
- individuals under the control of the organisation who are in training to develop the necessary skills, knowledge, experience and behaviours are appropriately supervised.

BS 8670-1:2024 Competence frameworks for Building Safety

People have the right to expect that buildings and their immediate environment are designed, built and maintained safely.

Assuring the competence of all who work in industries within the built environment sector throughout the life cycle of a building is key to achieving this outcome.

This part of BS 8670 sets core building safety criteria for built environment competence frameworks.

It is intended that the core criteria be contextualized within sector-specific frameworks to reflect the appropriate scope and level of competence required for an individual to undertake a defined role, function, activity or task.

BS 8670-1:2024

Competence frameworks for building safety

Part 1: Core criteria – Code of practice

bsi.

Table 2 — Fire safety, structural safety and public safety

Core competence criteria		Scope		
a)	Understand and contribute to the development and application of fire strategies, practices and technological systems in buildings.	1) 2) 3)	 Foundation principles of fire safety, including: i) principles of fire chemistry and physics, including ignition and heat transfer; ii) the influence of structure, construction product selection and building systems on fire safety performance; iii) human behaviour and escape requirements; and iv) methods of fire suppression and how to limit fire growth and fire spread Fire safety design concepts and strategies that enable safe use and occupancy of a building, including integration of the principles of inclusive design. Prevention, mitigation and control functionalities of fire protection technologies and systems that detect, alert and confine fire growth and effluents; suppress ignition and fire; ventilate and secure escape or reduce fire spread; and reduce risks involved in firefighting and rescue.

Section 7 Building Safety

Does your company have arrangements in place to manage and record evidence of competency (Skills, Knowledge, **Experience** and Behaviours) for your workforce and key subcontractor roles?

Please provide supporting evidence

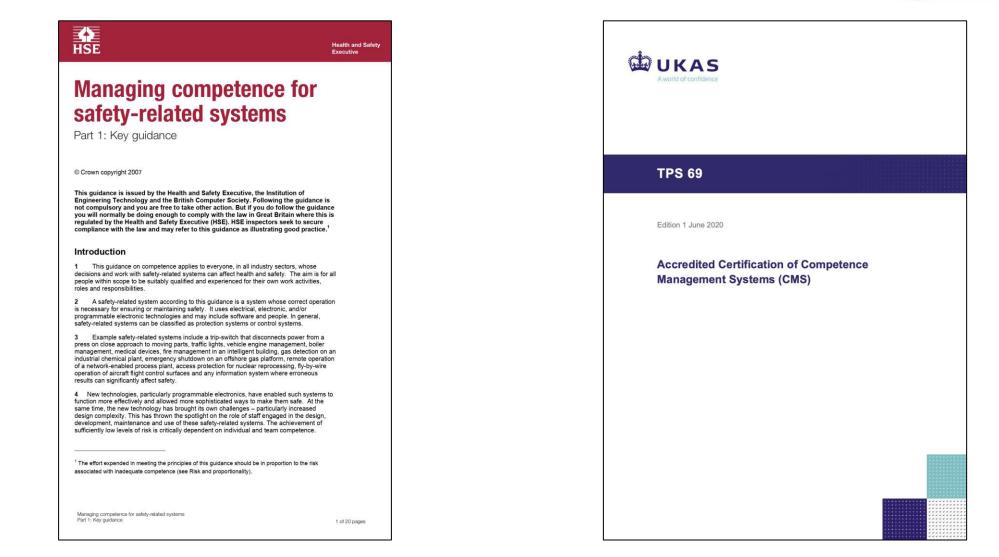

- A process for identifying competence requirements for the entire workforce and sub-contractors in accordance with BS 8670
- A Training Needs Analysis (TNA) for the entire workforce
- Evidence of records held including training records, certificates of attendance, CPD programmes, competency management matrixes, copies of CSCS Alliance cards etc.
- Evidence of a training culture including records, certificates of attendance and adequate induction training.
- Dedicated training on your Quality Management Policy or arrangements
- Evidence of an active CPD programme

HSE Competence model

1. Each role has its own set of competence criteria, derived from the work activities that make up the role.

- 2. An individual's role is specified in terms of the work activities that they must be able to undertake. The associated competence criteria specify the knowledge, skills, experience and behaviour that is necessary for the individual to be considered competent for the role.
- 3. To determine if an individual is competent to carry out their role, they are assessed against the predetermined competence criteria.
- 4. The person is deemed competent for the role if their evidence demonstrates that the competence criteria for the role have been met.
- 5. If the assessment discovers minor shortfalls in competence, it may be possible for the individual to perform a very similar role with the addition of well-defined precautionary measures such as increased supervision.

HSE Competence Management Principles

Principle 1: Define purpose and scope according to risk

Objective: To specify all work activities to be included in the CMS, based on the risk associated with those activities.

Principle 2: Establish competence criteria

Objective: To select or develop a suite of competence criteria that covers all activities within the scope of the CMS and gives sufficient confidence that all staff that meet particular criteria are competent to perform the related work activity.

Principle 3: Decide processes and methods

Objective: To establish efficient and consistently repeatable processes, procedures and methods that implement the requirements of the principles.

Principle 4: Select and recruit staff

Objective: To select internally, and recruit externally, staff that have an appropriate and demonstrable competence profile.

Principle 5: Assess competence

Objective: To determine the extent to which staff currently meet the established competence criteria.

Principle 6: Develop competence

Objective: To extend and maintain the competence of staff so that they are able to meet relevant competence criteria.

Principle 7: Assign responsibilities

Objective: To ensure that staff and suppliers undertake only work for which they have been assessed as competent.

Principle 8: Monitor competence

Objective: To monitor whether or not staff assessed as competent are continuing to perform competently and to initiate corrective action where appropriate.

Principle 9: Deal with failure to perform competently

Objective: To respond to failures to perform competently so that the impact on safety is minimised, including initiating actions to restore the competence of individuals.

HSE Competence Management Principles

Principle 10: Manage assessors' and managers' competence

Objective: To ensure that senior managers, managers of the CMS and assessors are competent to support and fulfil the requirements of the CMS.

Principle 11: Manage supplier competence

Objective: To ensure that all relevant work activities of suppliers are always performed by competent staff.

Principle 12: Manage information

Objective: To maintain accurate information from the operation of the CMS, in sufficient detail to enable efficient operation and to demonstrate that its requirements are being met.

Principle 13: Manage change

Objective: To monitor changes in the internal operation of the organisation and its external environment, to determine implications for individuals, teams and the CMS and to initiate changes as appropriate.

Principle 14: Audit

Objective: To audit the CMS with sufficient frequency to give confidence that it is meeting its objectives and operating as intended, and to initiate improvement action where appropriate.

Principle 15: Review

Objective: To review identified changes and the combined evidence on the operation of the CMS generated from dealing with competence failures and from audits, and to initiate improvements to the CMS as appropriate.

Organisational Capability Standard

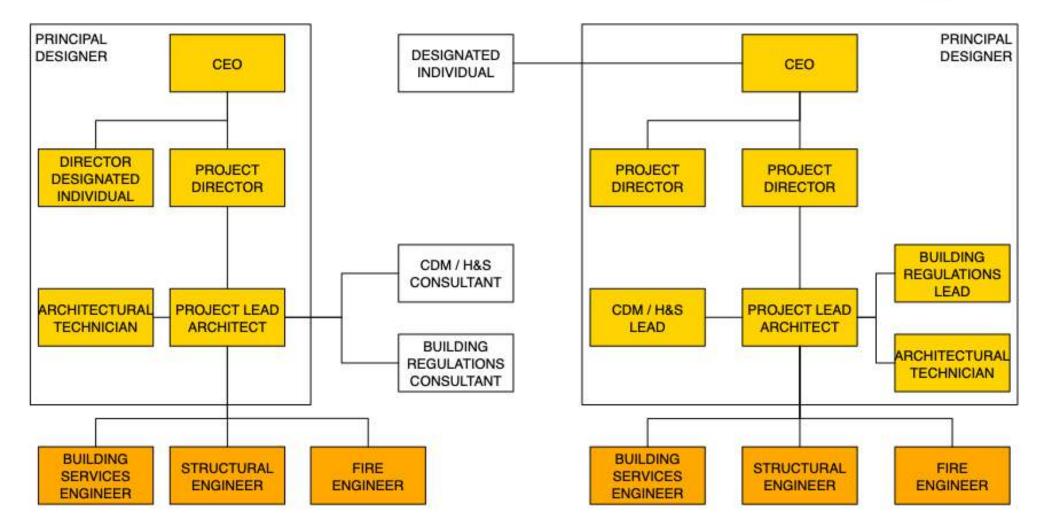

Organisational capability: (the management of competence) means having the appropriate management policies, procedures, systems and resources to ensure:

- the organisation has the collective skills, knowledge, experience and behaviours [SKEB] that are required to deliver their identified objectives and contractual obligations;
- individuals under the control of the organisation:
 - who are carrying out work on behalf of the organisation, have the necessary SKEB to deliver their role in accordance with all statutory requirements;
 - who are in training to develop the necessary competence, are appropriately supervised by individuals with SKEB that is appropriate to their supervisory role;
- organisations engaged by the company have the necessary organisational capability; and
- an appropriate standard of organisational culture.

Establishing the organisational structure

Design management systems

Part 4: Managing design in construction - Guide

Scope

This part of BS 7000 gives guidance for all types of construction projects on:

- a) the design and construction processes of the built environment; and
- b) the management of design activities throughout the design and construction period.

It is intended for those who work in and with the construction industry, particularly those managing the design process. Where general management principles are given, they may be adapted to suit any size of organization or construction project.

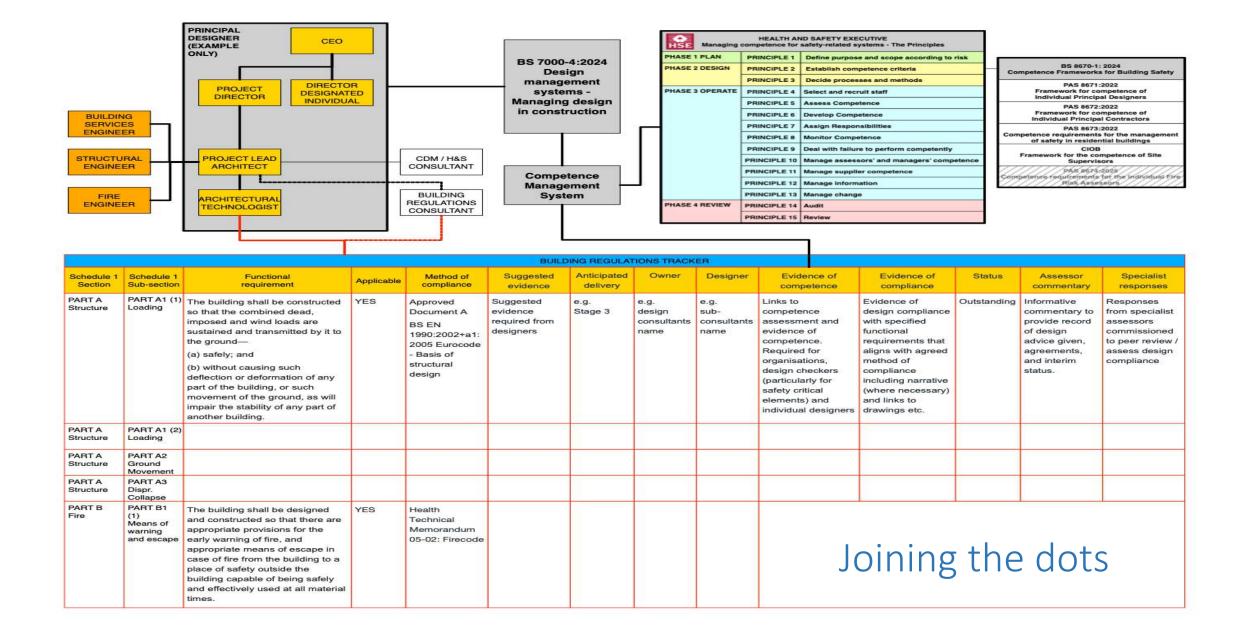

4.2.3 Competence

The competence of the individuals and organizations working on a project is critical to the success of any outcome. Due to growing legislation and evolving design and construction technologies, it has become increasingly important to focus on competence frameworks and assessments. One such framework, set out in BSI Flex 8670, builds on the definition of competence set out in the Construction (Design Management) (CDM) Regulations 2015 [1] and provides an approach to measuring competence that takes into account skills, knowledge, experience and behaviours as shown in Figure 4.

5.2 Design management plan (DMP)

Once assigned to a project the principal supplier should mobilize resources, including the design management lead, to compile the DMP so that the delivery team can collaborate effectively.

Solutions for the early integration and accident prevention of migrant labour

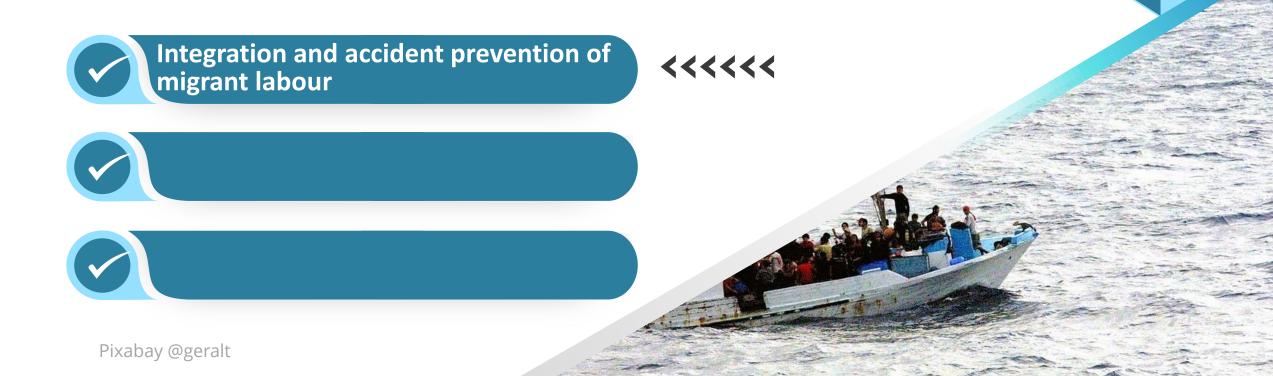

Safe construction under extreme conditions

Effective international training and sharing experience in construction safety

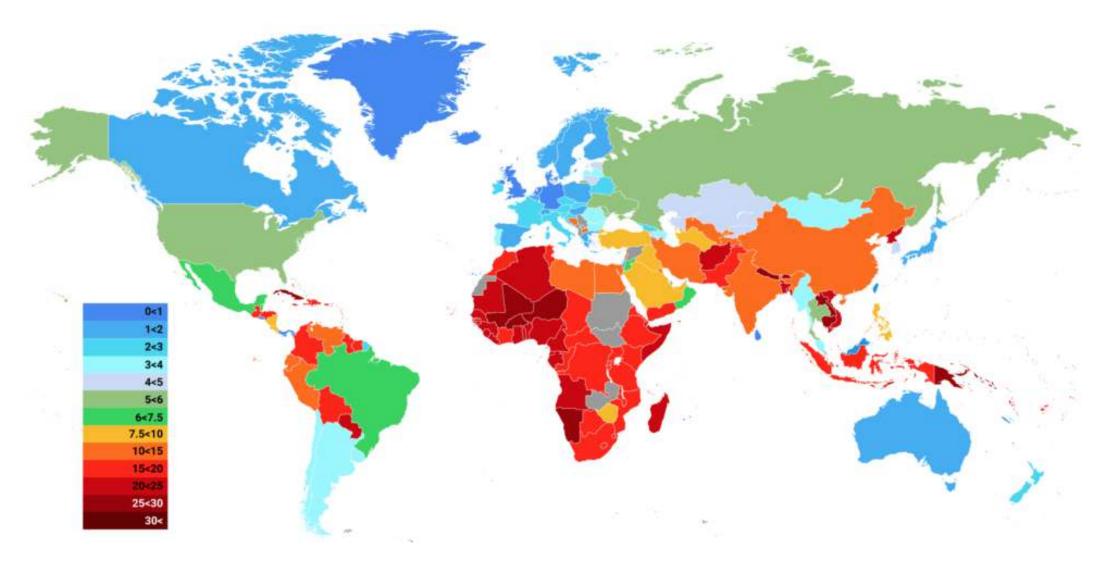

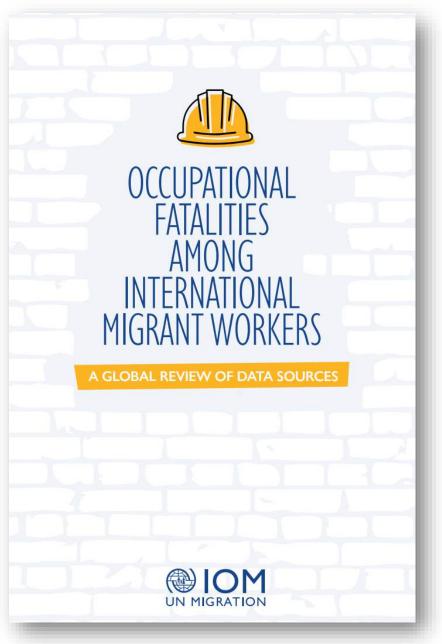

Managing labour migrants

Health and Safety

What is the rate of fatal accidents and work for 100.000 workers worldwide?

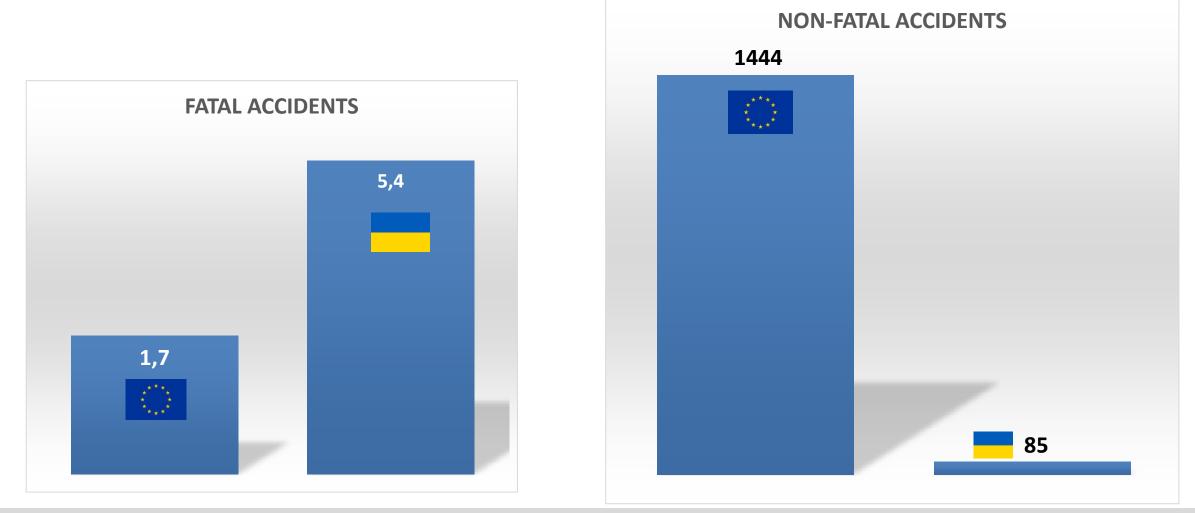

PROPOSALS:

- 1. Harmonization of the data to international standards and within countries
- 2. Accurate data on the cause of death
- 3. Improve knowledge and availability of data on fatal occupational diseases among migrants
- 4. Innovative methods and sources to identify hidden migrant groups

https://publications.iom.int/system/files/pdf/Occupational-Fatalities.pdf

Example: Comparison of accidents at work for Ukraine and EU per 100 000 employees, 2020

Thank you for your attention!

PLATONAS STYLIANOU ECCE PRESIDENT

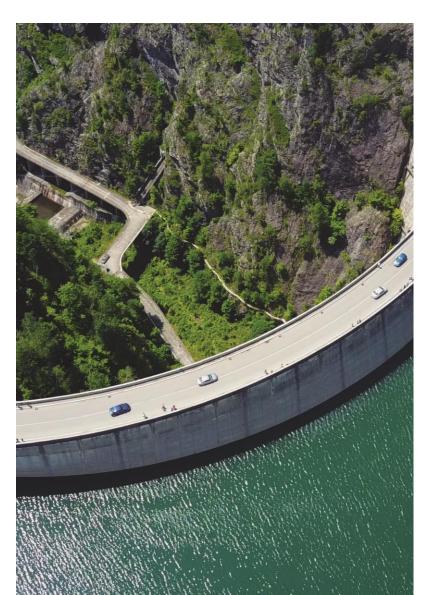

Building a resilient future

Climate-proof design of infrastructure for generations to come

Platonas Stylianou Chartered Civil Engineer ECCE President EDI 03 2025

Building a resilient future

The European Council of Civil Engineers (ECCE) since its establishment in 1985, promotes the cooperation of European civil engineers as being of significant value not only to engineers but also for European society.

ECCE supports and enables European civil engineers to advance a more sustainable and resilient built environment and to protect the natural environment. It does this by working with its national member organizations from 24 countries and partner organizations at the European level, to promote the highest technical and ethical standards for engineers, to positively influence the development of the profession and the construction industry, and to be a force for good in European society.

In 2021 and in 2023 the United Nations' Intergovernmental Panel on Climate Change released very important reports warning that climate change "is widespread, rapid, and intensifying." Prepared by 234 scientists from 66 countries, the IPCC report declared that human-induced climate change "is already affecting many weather and climate extremes in every region across the globe in the atmosphere, in the oceans, ice floes, and on land."

U.N. Secretary-General António Guterres described the report as "a code red for humanity," adding that the "alarm bells are deafening, and the evidence is irrefutable."

The world's climate is changing — and those changes are bringing significant impacts that will affect the way infrastructure is designed and constructed. <u>The effects of climate change may be globally magnified especially</u> in coastal cities, which could face increasing heat and heavy precipitation. Extreme sea level events that previously occurred once in 100 years could happen much more often by the end of this century. **The civil engineering profession has a significant role to play in helping the world adapt to these new conditions.**

Human activities, principally through emissions of greenhouse gases, have unequivocally caused global warming.

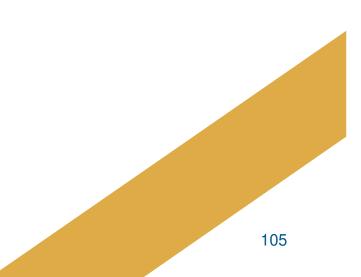

Global greenhouse gas emissions have continued to increase, with unequal historical and ongoing contributions arising from unsustainable energy use, land use and land-use change, lifestyles and patterns of consumption and production across regions, between and within countries, and among individuals.

The increasing frequency and severity of extreme weather events <u>underscore the need for climate-resilient</u> <u>infrastructure.</u>

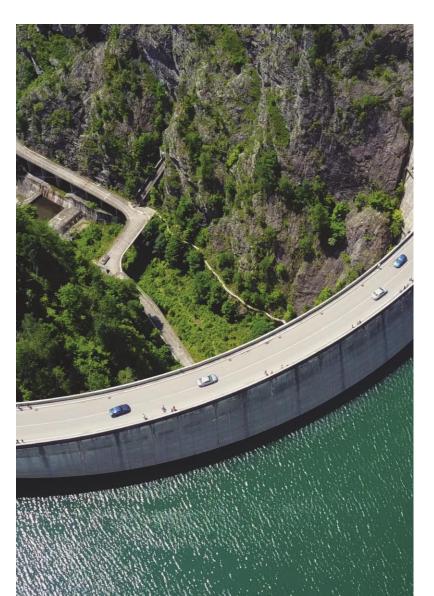

Civil engineers <u>must move beyond traditional design parameters and anticipate the impacts of a</u> <u>changing</u> climate, ensuring that infrastructure can withstand unprecedented conditions and protect communities from the devastating effects of climate change.

So, Civil Engineers must: adapt, improve, and

- Design for Adaptability and Flexibility
- Prioritise Nature-Based Solutions for Resilience
- Promote of Climate Resilient Infrastructure

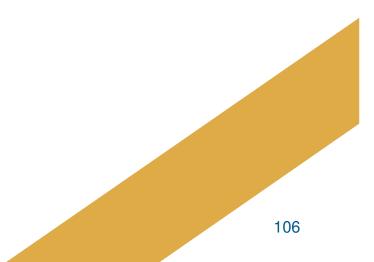

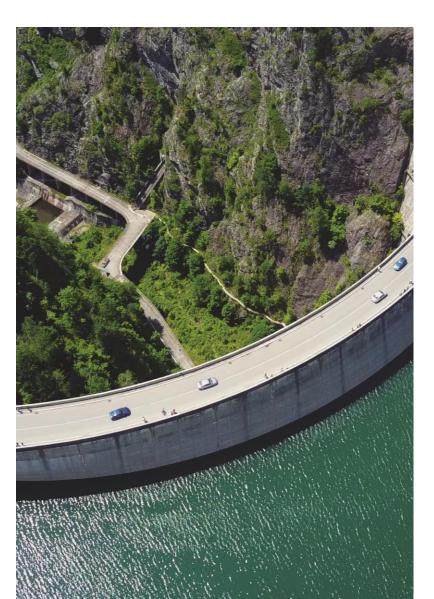

UN climate summit

The climate crisis necessitates urgent and decisive action from all sectors, including civil engineering. The critical priorities and actions required to ensure sustainable and resilient infrastructure development in the face of a changing environment, may be summarised as:

- Emission Reductions
- Protection of Vulnerable Populations
- Transitioning from Fossil Fuels
- Enhancing Climate Resilience
- Securing Financial Resources
- Civil Engineering's Role

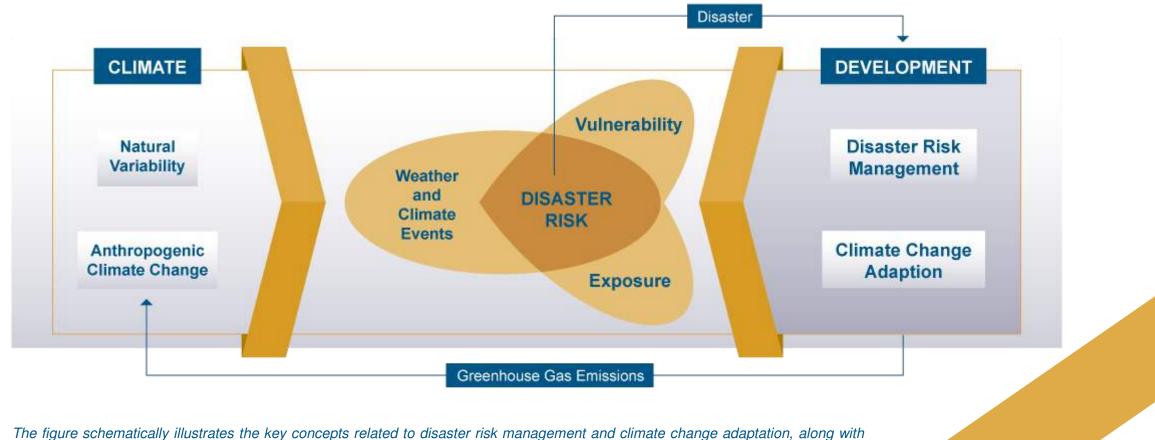

For ensuring this, the EU has aimed to achieve a range of milestones and agreements including:

- → reducing greenhouse gas emissions by 43% by 2030.
- establishing new funding to assist developing countries that are particularly affected by climate change.
- → encouraging major emitters to set new emission reduction targets.
- \rightarrow proposing new rules to boost international carbon markets.

As the European Council of Civil Engineers, we recognize the critical role civil engineers play in shaping resilient, sustainable, and equitable infrastructure. Guided by our Strategic Plan, we are committed to principles that support these objectives. This manifesto reflects the ECCE Strategic Plan 2023–2030, which empowers European civil engineers to advance a sustainable built environment while safeguarding the natural world.

Climate Change: New Dimensions in Disaster Risk, Exposure, Vulnerability and Resilience

their interaction with sustainable development.

Figure referenced from: Climate Change: New Dimensions in Disaster Risk, Exposure, Vulnerability and Resilience document.

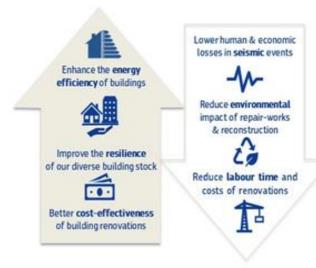

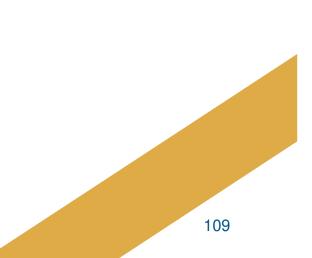

Executive summary

This manifesto underscores the urgent need for the civil engineering profession to transition from climate pledges to concrete actions.

It emphasizes the pivotal role of civil engineers in shaping a sustainable and resilient future by incorporating climate considerations into every facet of infrastructure design, construction, and operation. This aligns with the ECCE Strategic Plan 2023-2030, which focuses on enabling European civil engineers to advance a more sustainable built environment and protect the natural environment.

CHANGING

THE CODES

lanifesto key themes

Key areas of action for ECCE members highlighted in this manifesto include:

CHAMPIONING

SUSTAINABLE

FINANCING &

INVESTMENT

ENHANCING CLIMATE RESILIENCE IN INFRASTRUCTURE DESIGN, CONSTRUCTION, MAINTENANCE AND OPERATION STRENGTHENING CARBON ACCOUNTING & TRANSPARENCY

 \bigcirc

FOSTERING COLLABORATION & KNOWLEDGE EXCHANGE PROMOTING SOCIAL EQUITY & COMMUNITY ENGAGEMENT

EDUCATION & CAPACITY BUILDING

Enhancing Climate Resilience in Infrastructure Design

Forward-Looking Design: Integrate climate projections into infrastructure planning.

Updated Standards: Adapt building codes for future climate challenges (sea level rise, extreme weather).

Adaptability & Flexibility:

Design infrastructure that can evolve with changing conditions.

Nature-Based Solutions:

Use green roofs, permeable pavements, and urban forests for resilience and co-benefits.

Enhancing Climate Resilience in Infrastructure Design

Continuous Adaptation Process for Resilient Infrastructure

Current Infrastructure Design

"Infrastructure based on past climate data, often lacking flexibility to cope with emerging climate impacts like heat, flooding, and sealevel rise."

Design Adaptation for Immediate Future

"Infrastructure designed to adapt to near-term climate changes, with flexible, modular systems and upgrades for increased resilience."

Future-Proof Infrastructure (Long-Term Design Flexibility)

"Advanced, flexible infrastructure designed to evolve with future climate changes, using smart systems and nature-based solutions for long-term resilience."

Championing Sustainable Financing and Investment

Securing Investment: Advocate for funding climate-resilient infrastructure.

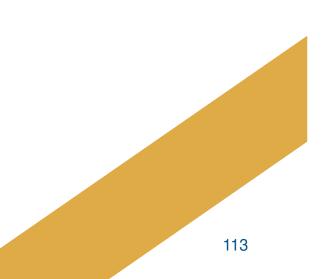

Engaging Investors: Communicate environmental and social returns of sustainable projects.

Innovative Financing:

Utilize public-private partnerships and green bonds to mobilize capital.

Policy Support:

Push for frameworks that incentivize sustainable infrastructure investments.

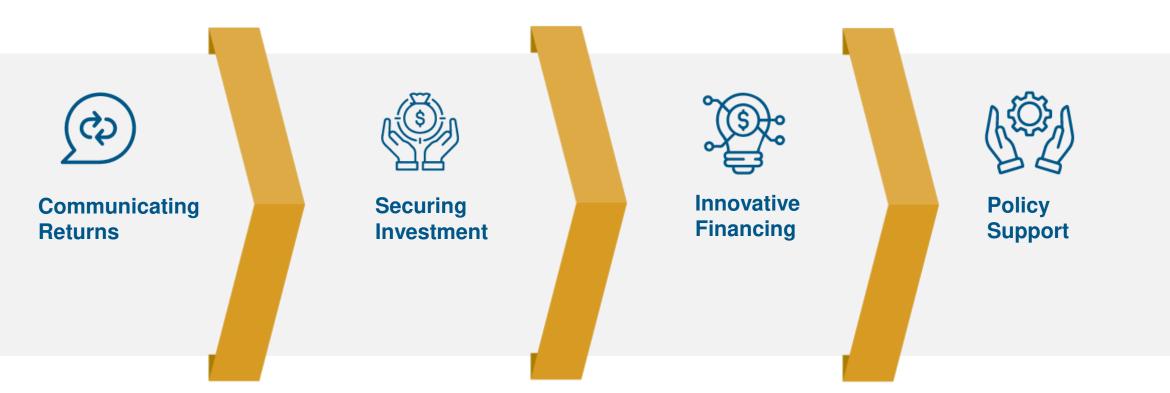

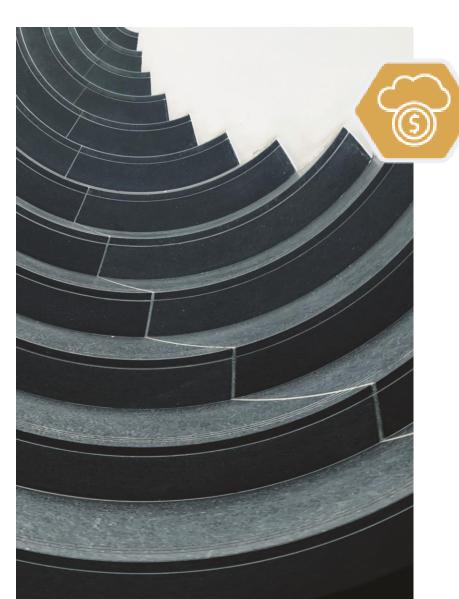

Championing Sustainable Financing and Investment

Investor Engagement Pathway

Strengthening Carbon Accounting and Transparency

Rigorous Carbon Accounting: Track emissions for accountability and progress.

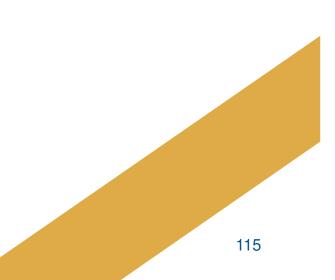

Whole-Life Carbon Assessment: Evaluate carbon footprint from material extraction to decommissioning.

Standardized Reporting:

Enhance transparency and comparability across projects.

Data-Driven Decisions:

Use carbon data to guide materials, construction, and operations.

Strengthening Carbon Accounting and Transparency

Carbon Accounting Flowchart

Whole-Life Carbon Assessment

Evaluate carbon emissions at every stage, from material sourcing to decommissioning.

Standardized Reporting

Use reporting frameworks to standardize carbon data, ensuring transparency and enabling comparison across sectors and projects. Carbon Data in Decision-Making

Integrate carbon data to guide material choices, construction methods, and operational strategies.

Fostering Collaboration and Knowledge Exchange

Engage globally:

Connect with international networks to share knowledge on sustainable infrastructure.

Capacity building:

Train engineers to promote climate-resilient practices.

Open-source collaboration:

Share data and resources to drive innovation in sustainable infrastructure.

Collaborative transition:

Policymakers, industry, and academia must work together—setting targets, adopting sustainable materials, and advancing research.

Fostering Collaboration and Knowledge Exchange

Promoting Social Equity and Community Engagement

Socially Equitable Infrastructure: Prioritize the needs of vulnerable communities.

Inclusive Engineering: Amplify community voices in planning and implementation.

Well-Being Focused Design:

Ensure infrastructure benefits all, especially climate-vulnerable populations.

Education and Capacity Building

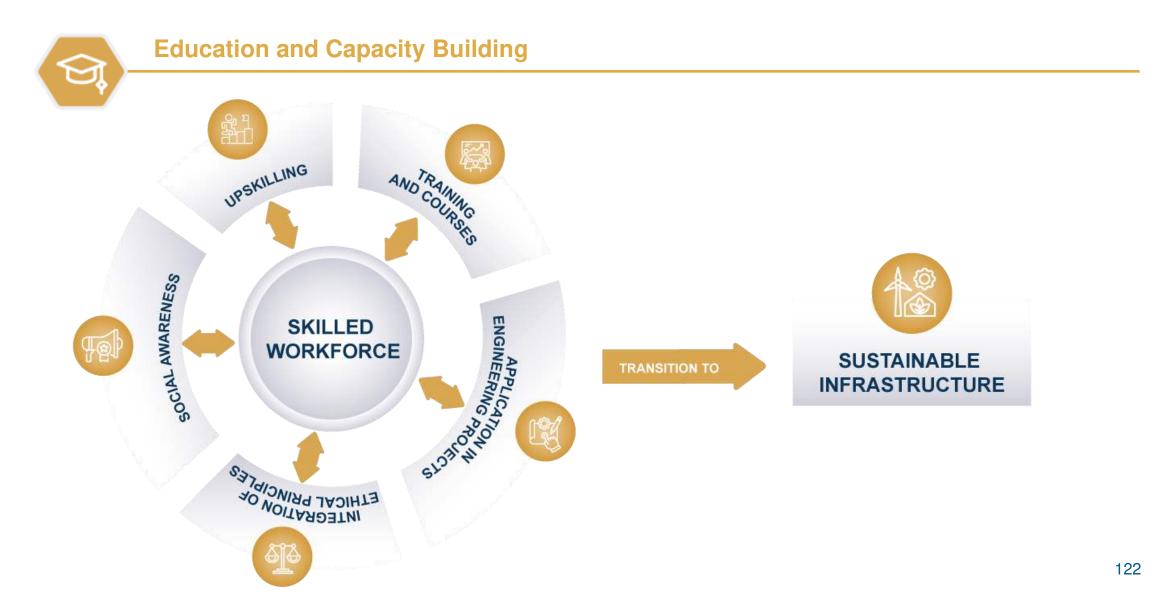

Skilled Workforce for Sustainability: Equip engineers for climate-resilient infrastructure.

Training & Resources: Provide knowledge platforms for sustainable design and construction.

Sustainability in Education: Integrate climate principles into engineering curricula.

Beyond Technical Skills: Address social and ethical responsibilities for equitable infrastructure.

Changing the Codes

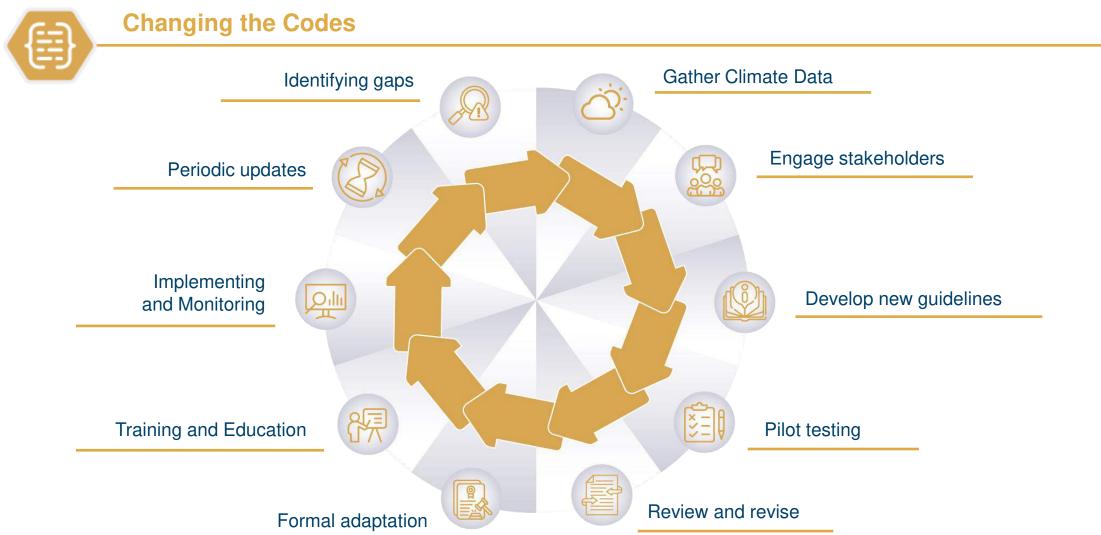

Updating Standards: Adapt codes to address climate change impacts.

Climate Projections & Resilience: Integrate future climate risks into regulations.

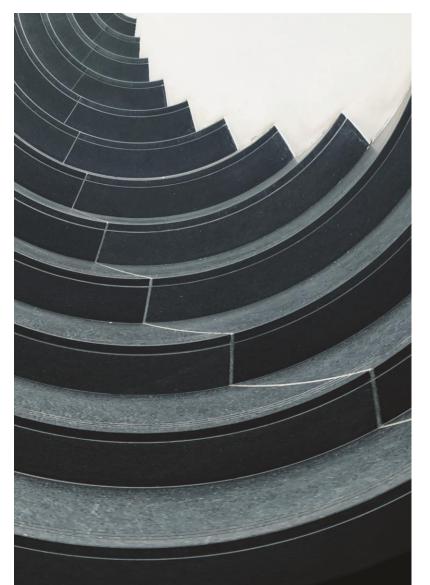

Dedicated Guidelines:

Develop standards for climate-resilient infrastructure.

By embracing these principles and actively working towards their implementation, ECCE and its members can play a leading role in shaping a more sustainable and resilient future for Europe and beyond.

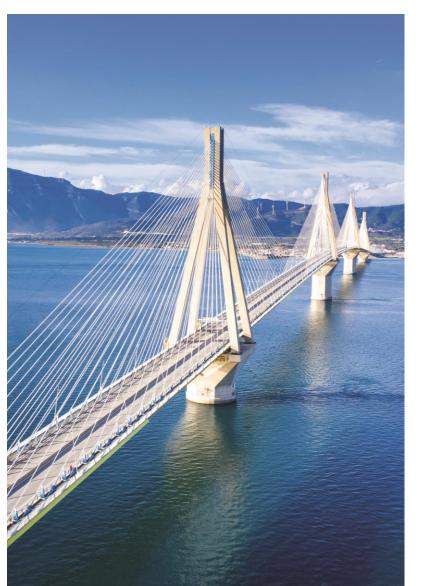

By taking the lead in decarbonizing infrastructure and promoting climate adaptation, ECCE members will not only contribute to Europe's sustainability but also set an example for the global engineering community, encouraging wider adoption of these crucial principles.

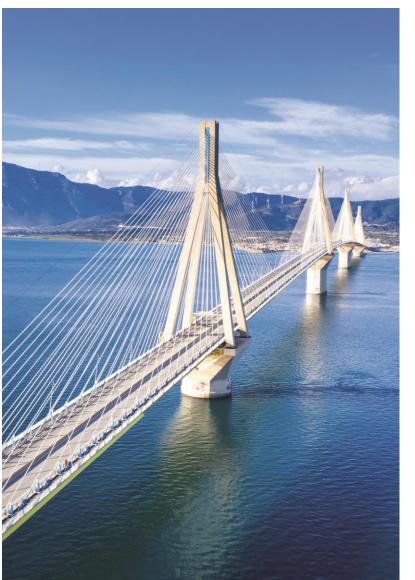

The global response to climate change is at a critical turning point, offering civil engineers an opportunity to lead in creating sustainable and resilient infrastructure. Despite the challenges, the potential for meaningful environmental impact is immense. Through innovation, collaboration, and a commitment to sustainability, **ECCE members can develop infrastructure that balances human needs with planetary health**.

Clear priorities for sustainable development provide a pathway forward, aligning with ECCE's strategic focus on leadership in infrastructure that harmonizes societal needs with ecological responsibility. The road ahead is demanding, but the chance for transformative progress is extraordinary. Through innovation, collaboration, and dedication to sustainability, ECCE members can shape infrastructure that balances human needs with planetary health.

ECCE's strategic priorities emphasize leadership in sustainable infrastructure that harmonizes societal demands with ecological stewardship. The journey ahead is demanding, but the opportunity for transformative progress is unparalleled.

ECCE therefore reaffirms its commitment to a sustainable and equitable future, recognizing that the civil engineering profession is pivotal in achieving global climate goals. Together, we will build infrastructure that is not only robust and efficient but also environmentally and socially responsible.

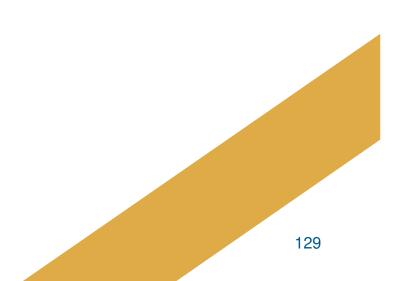

ECCE calls upon all member organizations, individual engineers, and stakeholders to embrace this shared vision and to **collaborate** in transforming these **principles** into **actionable** outcomes.

So, as ECCE we declare that all Engineers must innovate, be pioneers and create new designs, and improve existing techniques, for a better, safer, greener, more sustainable and more resilient Europe, in safeguarding a better future for all.

ECCE urges all member organizations, individual engineers, and stakeholders to embrace this shared vision and work together to turn these principles into tangible actions.

As ECCE, we affirm that engineers must be innovators, pioneers, and creators of new designs while also enhancing existing techniques. Their mission is to build a better, safer, greener, more sustainable, and more resilient Europe, ensuring a brighter future for all.

BUILDING A RESILIENT FUTURE

Building

a resilient future

Climate-proof design of infrastructure for generations to come

DokaXact allows safe pouring

Reservoir Zott, Mertingen | Germany

Technical details

- Casting height = 11,74 m
- Design pressure = 80 kN/m²

The challenge

- Different compaction methods in use
- Concrete mix with retarding admixture

Our customers' achievement with DokaXact
Speed of placing = 1,00 m/h

Monitoring of concrete temperature & strength

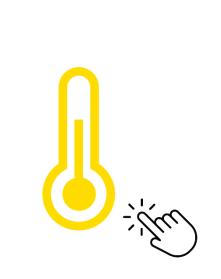

Concremote

Fields of application

Concremote

Working with CO₂-reduced concrete

Temperature monitoring in mass concrete Monitoring of early-age **compressive strength**

Fair-faced concrete projects

Versatile hardware line-up

Hardware

Reusable device in one handy unit for all horizontal parts.

The slab sensor combines the sensing element and wireless transmitting unit in one device.

Reusable cable sensor and wall sensing element for walls.

The wall sensing element can be incorporated in any formwork and the cable sensor transmits the data wirelessly to the cloud.

Mass concrete

Monitoring of temperature & strength inside the structure.

The multi-sensor cable accurately measures the temperature inside the concrete and the cable sensor transmits the data wirelessly to the cloud.

Transparency on greenhouse gas emissions with the Product Carbon Footprint

 (\rightarrow)

 $(\rightarrow$

What is the PCF?

PCF provides a comprehensive greenhouse gas (GHG) footprint across life phases of a product.

The unit of the indicator is kg or t of **CO₂eq.**

Why care about the PCF?

- This data can be used to calculate **Scope 3** (primary data).All European and Californian companies will be obligated to do this in the near future.
- Better ratings at supplier assessments & scorings, as well as advantages at tender requests.
 - Take more sustainable decisions and reduce your Scope 3 emissions evidence-based.

7000 products

Specific order or period of time

For rental and sold products

* kg CO₂ eq. of life cycle phases A1, A2 and A3 / month of use

Transparency on greenhouse gas emissions with the Product Carbon Footprint

Comparing products for sustainable decisions

Meeting sustainability requirements

The construction industry is responsible for nearly 40% of global emissions. Decarbonizing this sector is crucial. That's why public tenders are increasingly demanding transparency, requiring contractors to disclose the CO_2e footprint of construction sites and products. At Doka, we support you in your mission to successfully meet new sustainability requirements.

Making evidence-based decisions

As a Doka customer, you can compare the carbon footprints of our products to make informed and eco-friendly decisions. By doing so, you can improve your company's CO₂e footprint.

Calculate Scope 3 emissions more easily

The Corporate Sustainability Reporting Directive (CSRD), passed by the EU Parliament in 2022, will require most companies to calculate their greenhouse gas emissions on a broad basis. This includes both direct and indirect emissions from upstream and downstream supply chains. We help our customers calculate their Scope 3 emissions by providing the necessary data on our products.

We aim to make a positive impact on the environment by supporting our customers in achieving their own sustainability goals.

> Julia Weber Head of Sustainability Doka

PCF Industry Standard

GSV Industry Standard on PCF calculation – Doka as one of the main contributer

The Güteschutzverband Betonschalungen Europa e.V (GSV)), a European association of manufacturers, suppliers and users of formwork and scaffolding systems, set up a working group with the aim of developing a standard for the transparent quantification of a GSV Product Carbon Footprint (GSV-PCF-Standard) for the formwork and scaffolding sector. The agreement on minimum standards, which has now been published after less than a year, is the result of intensive cooperation. With this step, Doka and its market partners are not only setting a new standard in the industry, but are also helping to establish the transparency on GHG emissions as a standard in the value chain.

"We are delighted to have been able to contribute our many years of experience and our calculation methodology to the GSV joint working group. This industry-wide agreement between leading manufacturers brings us a big step closer to being able to better compare product carbon footprints, and thus to create a level playing field within the formwork and scaffolding industry," adds **Julia Weber**, Head of Sustainability at Doka. **All PCF data for Doka formwork already complies with the GSV-PCF standard.**

Doka has calculated the PCF for more than 7,000 formwork and scaffolding products.

Off Site Pre-assembly

- Assembly by experienced carpenters in warehouse-controlled environment
- Guaranteed quality & specification
- Can lead to reduced working at height
- Less manual handling on site

Off Site Pre-assembly

- Less tasks for site team
- Free up cranage & space on site
- Reduced reliance on workforce skills

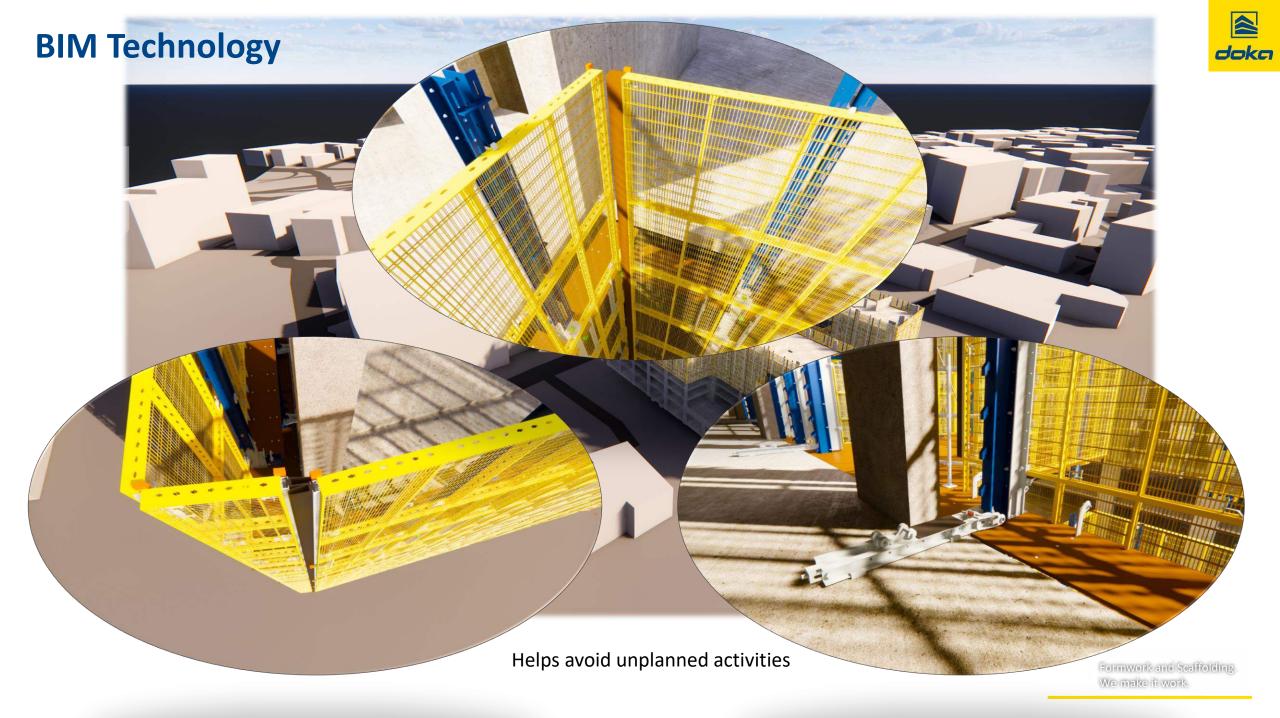

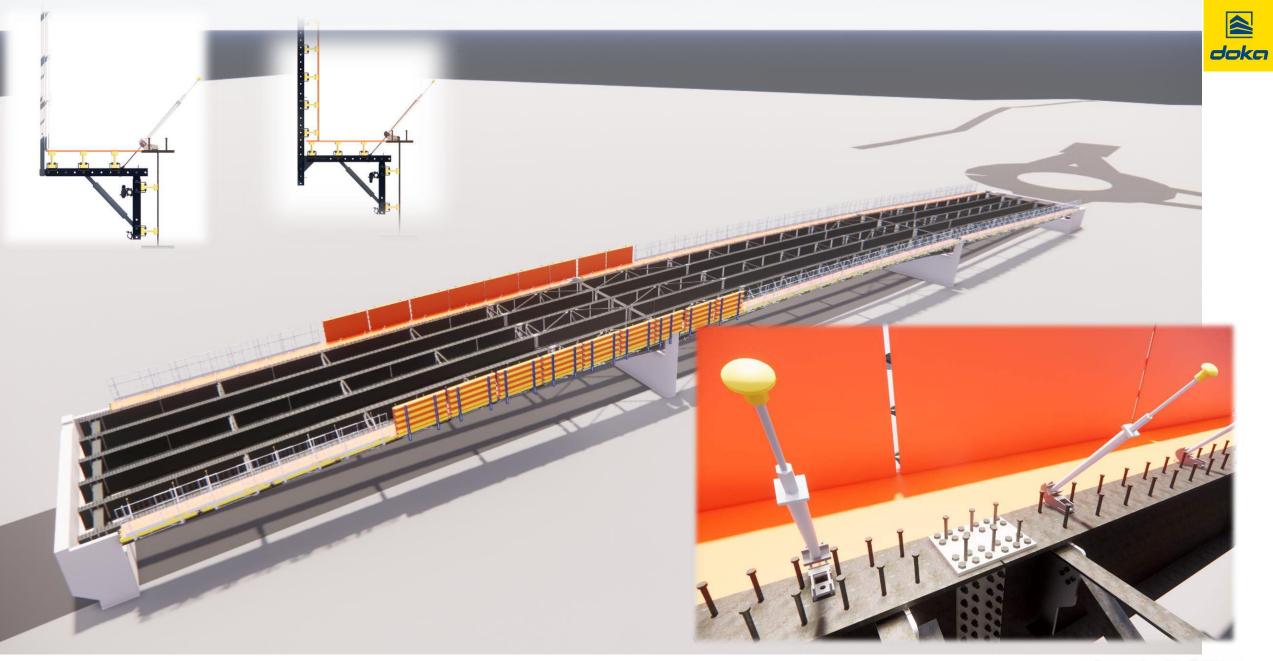

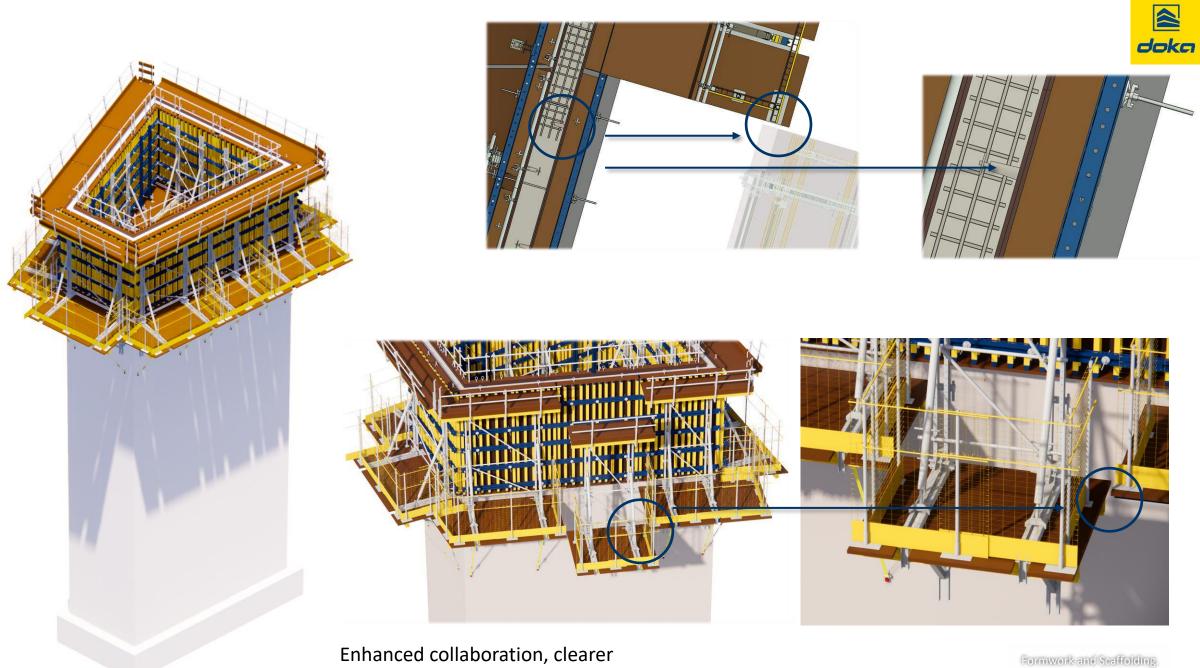

Formwork and Scaffolding. We make it work.

Clash detection & better understanding of solution

understanding of sequencing

We make it work.

Pete Kines, PhD Senior researcher Division of Safety Research pki@nfa.dk

'Vision Zero' companies in Europe

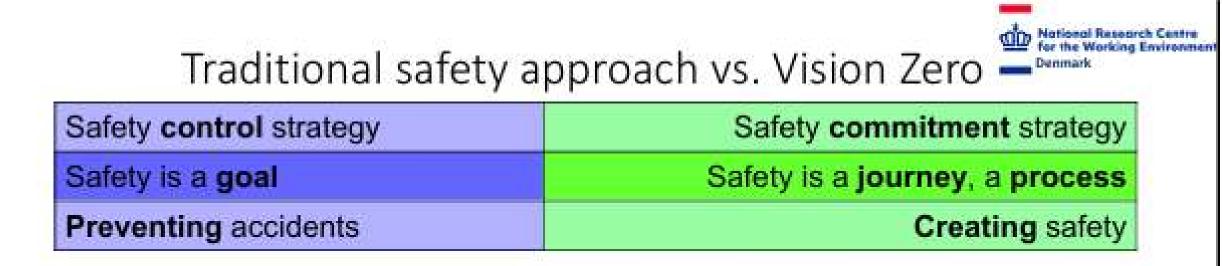

EU study – 'Vision Zero' companies

- 7 EU countries, 27 companies
- Interview, questionnaires and national workshops
- 8819 questionnaire respondents
- 66 % workers, 30 % leaders/managers/supervisors
- 13 manufacturing companies (51 % respondents)
- 7 construction companies (28 %)
- 7 other companies (21 %)

Zwetsloot, Kines et al., Safety Science, 2017 a & b

Traditional safety approach vs. Vision Zero -

Safety control strategy	Safety commitment strategy
Safety is a goal	Safety is a journey, a process
Preventing accidents	Creating safety
Safety programs	Safety an integrated part of business
Risk management	Business leadership
Safety management systems	Safety culture and learning

Traditional safety approach vs. Vision Zero -

Safety control strategy	Safety commitment strategy
Safety is a goal	Safety is a journey, a process
Preventing accidents	Creating safety
Safety programs	Safety an integrated part of business
Risk management	Business leadership
Safety management systems	Safety culture and learning
Safety owned by few	Safety owned by all
Safety is a cost	Safety is an investment
Workers are part of the problem	Workers contribute to solutions

Traditional safety approach vs. Vision Zero

Safety control strategy	Safety commitment strategy
Safety is a goal	Safety is a journey, a process
Preventing accidents	Creating safety
Safety programs	Safety an integrated part of business
Risk management	Business leadership
Safety management systems	Safety culture and learning
Safety owned by few	Safety owned by all
Safety is a cost	Safety is an investment
Workers are part of the problem	Workers contribute to solutions
Incidents are failures	Incidents are opportunities for learning
Benchmark on injuries	Benchmark on good-practice and leading indicators

Vision Zero

- Mutual commitment from owners, leaders and workers
- Policies, planning, procedures and practice
- All (serious) accidents and diseases are preventable
- A process not a goal

Vision Zero - Good practice 1

- OSH commitment a part of <u>hiring</u> process for <u>all</u> leaders and employees
- Involve <u>stakeholders</u>, business partners, subcontractors, suppliers, etc.
- <u>Relevant</u> communication strategy at all organisational levels
- <u>Multi-faceted</u> and <u>integrated</u> OSH initiatives that allow <u>decentralized</u> initiatives

Vision Zero - Good practice 2

- Ensure <u>relevant</u>, <u>qualified</u> and <u>structured</u> introduction, instruction, supervision and follow-up
- Vision Zero companies <u>leader-networks</u> (e.g. Finland 300+ companies, Germany 90+, Netherlands, etc.
- Action and learning from 'observations' and 'near-miss' incidents
- Reactive and proactive measures (KPI)

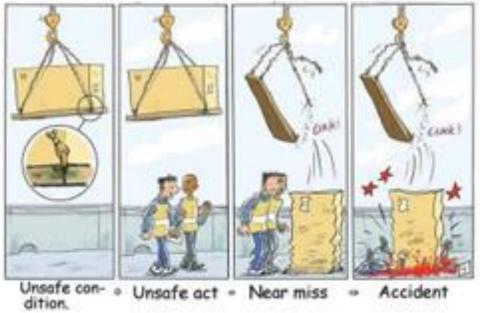

Measuring safety and health at work

Traditional goals measured by reduction in:

- Accidents and injuries
- Sickness absence
- Disease
- Insurance and compensation costs
- Early retirement

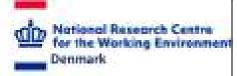

Leading indicators and actions

- Proactive
- Preventive
- Predictive

the Working Environment

Aim – develop a set of leading indicators

Request from industries

➢Benchmarking and KPIs'

➢Supplement to 'lagging' and 'reactive' indicators

➢Relevant for all three themes: safety, health and wellbeing

➢Relevant for small, medium and large enterprises

➤Easy to use (on paper or PC) ☺

Methods – international collaboration

- Literature review
- Companies from around the world small, medium and large, cross-sectoral

- International sector organizations: mining, construction, energy, trade and transportation
- Safety and health educators and trainers
- Safety, health and wellbeing researchers

Inputs from literature and industries

		Leading indicators			
	Safety, health and wellbeing themes	Literature	Industry		
1	Leadership commitment	12	6		
2	Identify and control hazards and risks	7	10		
3	Targets and programmes	14	8		
4	Ensure SHW system	10	24		
5	Well-designed equipment and workplaces	1	5		
6	Qualifications, competences	10	8		
7	Investing in people and participation	10	11		
	Totals	64	72		

Evidence from the London Olympics 2012

100 million working hours - low accident rates - no fatalities

Five success factors

- Visible impactful leadership
- Daily activity briefings
- Following-up near misses
- Taking action on reports
- Recognition and reward

Leading indicators – work briefings What do we count? How do we count it?

- ✓ Policy: SHW integrated
- ✓ Education
- ✓ Training
- ✓ Briefings (number, frequency)
- ✓ Follow-up
- ✓ Action
- ✓ Evaluation
- ✓ Learning

Subjective

The 14 Proactive Leading Indicators

- 1.1 Visible leadership commitment 1.2 Co
- 2.1 Evaluating risk management
- 3.1 Workplace and job induction
- 4.1 Pre-work briefings
- 5.1 Innovation and change
- 6.1 Initial training
- 7.1 Suggestions for improvement

- 1.2 Competent leadership
 - 2.2 Learning from unplanned events
 - 3.2 Evaluating targeted programmes
 - 4.2 Planning and organization of work
 - 5.2 Procurement
 - 6.2 Refresher training
 - 7.2 Recognition and reward

14 Fact sheets

←Aims

←Key concepts

←Good practice

←Limitations

←How to measure (3 options)
←Example of graphical results

Three options for using the indicators

Example indicator 4.1:

Are Safety, Health and Wellbeing an integrated part of discussions in <u>pre-work meetings</u>?

Option 1: YES / NO

Option 2: Frequency estimation - scale of 0 - 4, 'Never' to 'Always'

Option 3: Quantitative measurement – actual frequency or percentage

Option 1, the YES / NO checklist

	Safety		Health		Wellbeing		Total
	YES	NO	YES	NO	YES	NO	YES
1. Are SHW an integrated part of discussions in pre-work meetings?	٧		٧		V		3
2. Is the promotion of SHW included in procurement processes?	٧		٧			٧	2
3. Are SHW covered in refresher training?	٧			۷	٧		2
Etc. for all 14 indicators				(0.0			
"YES" total	12, (86	/14 5%)	1000	'14 %)	4/14 (29%)		22/42 (52%)

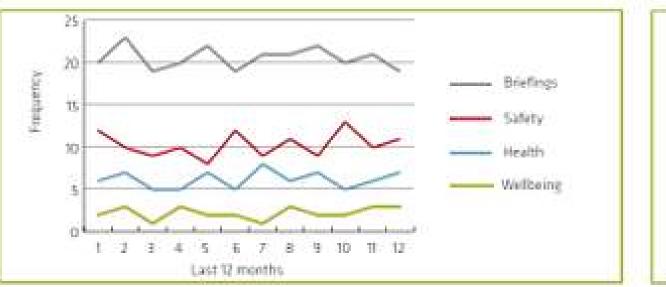

Option 2, Frequency estimation

To what degree are the following questions met? Use the following ratings: Always or almost always = 4; Frequently = 3; Occasionally = 2; Rarely = 1; Never or very rarely = 0	Safety	Health	Wellbeing	Total
1. How often are SHW an integrated part of discussions in pre-work meetings?	2	3	1	6
2. How often is the promotion of SHW included in procurement processes?	3	2	2	7
3. How often are SHW covered in refresher training?	4	3	3	10
Etc. for all 14 indicators			1110	- 226
Total	46/56 (82%)	32/56 (57%)	34/56 (61%)	112/168 (67%)

Option 3, Quantitative measurement

Frequency

Percent

How often are SHW an integrated part of discussions in pre-work briefings?

How often are SHW covered in refresher training?

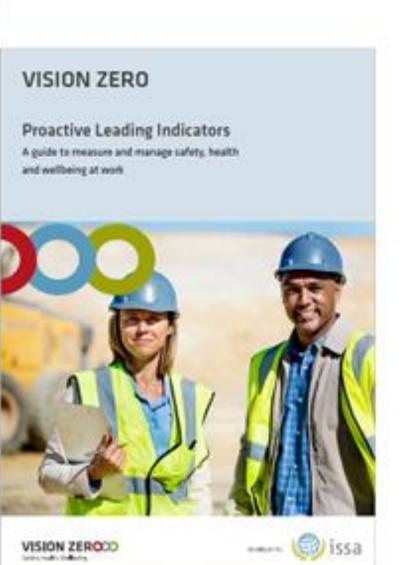

Working with leading indicators

- Identify your strengths and needs for improvement in SHW
- Discuss priorities with leaders and workers
- Adapt the indicators make them relevant for your context and resources
- Get experience with one or two indicators

Proactive leading indicators

ISO 19650-6:2025

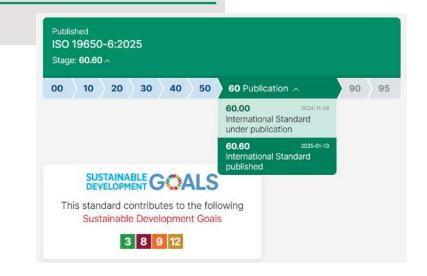

Organization and digitization of information about buildings and civil engineering works, including building information modelling (BIM) — Information management using building information modelling

Part 6: Health and safety information

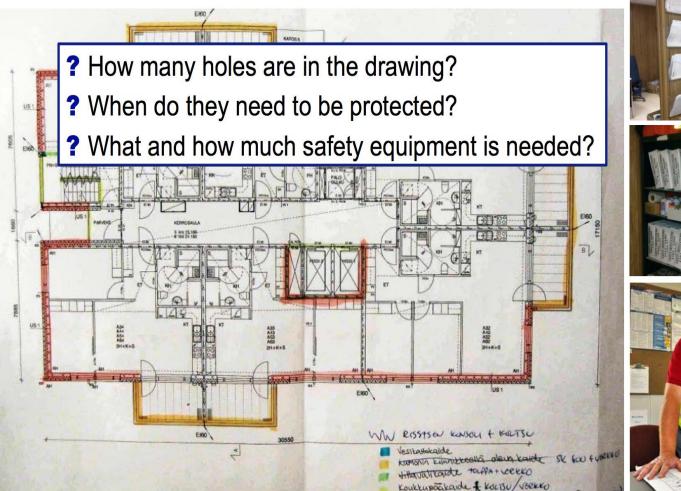

concept

DIGITAL REPRESENTATION OF THE PHYSICAL AND FUNCTIONAL CHARACTERISTICS OF AN INFRASTRUCTURE

Early identification, during the <u>design phase</u>, of risks and hazards associated with different phases of the infrastructure, using BIM tools and methodologies.

New model of Safety and Health Plan information:

- Construction Planning / Working Procedures;
- Construction Site Plan;
- Construction Site Emergency Plan;
- Collective Protective Equipment (CPE) Plan;
- Access Control Plan (authorized person);

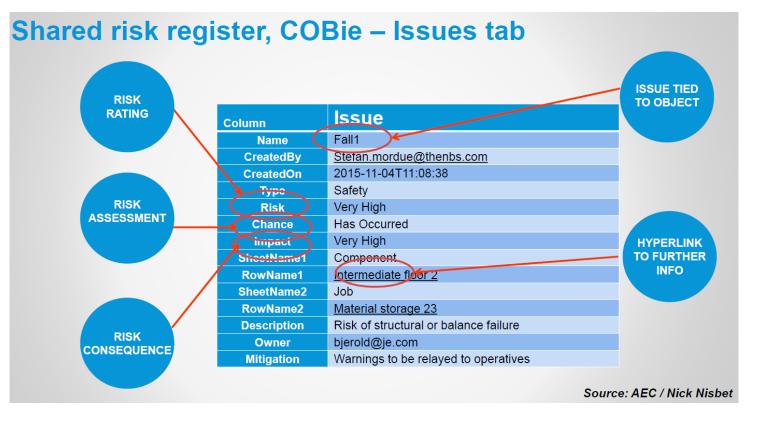

New model of <u>Safety and Health File</u> information :

- Facility Management (FM) / Operation procedures;

. . .

Information in the object

- □ OSH information is parametrized
- □ Hazard, risk, risk evaluation, preventive measures
- □ Links to other information: pdf, dwg, etc

Information in the object

Example:

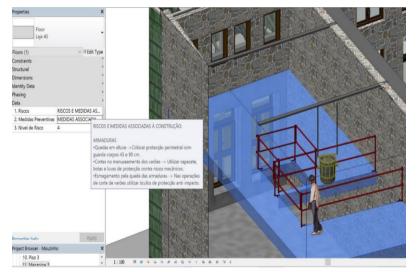

Construction and rehabilitation work in the historic center of Porto – Portugal

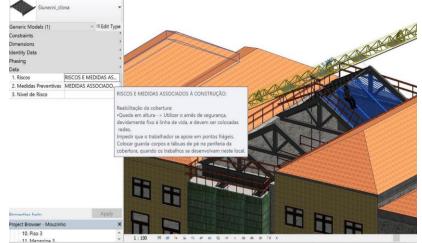

- □ Hazard, risk,
- □ Risk evaluation
- □ Preventive measures

3D SHAPE

0

Information in the object

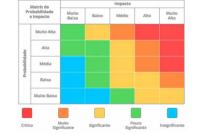

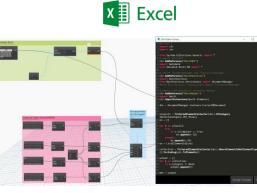

RISK ASSESSMENT OF THE TASK (ACTIVITY) ASSOCIATED TO PRODUCT (OBJECT) Example: **Building a "Window" (BIM object/product)**

- Alpha information risks and preventive measures
- Numeric information scale from trivial risk (1 green) to intolerable risk (5 red)

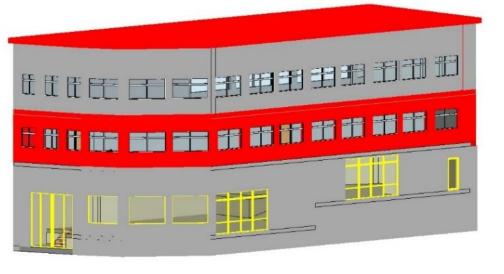

Risk Assessment System (NTP

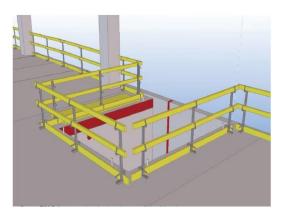

Construction Site Planning

Without **BIM**:

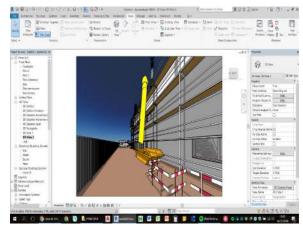

- Construction site not included in drawing
- Temporary facilities not considered
- Spatial and temporal incompatible tasks

With BIM

- Pre-modelled objects
- Construction site is part of the model
- Space and volume optimization
- Spaces and critical schedules
- Integration of temporary facilities in the model
- Constraints (traffic, neighbourhood)
- Safety perimeters

Contract Information Management

buildingSMART Portugal

This document is an example of an **EIR** (Exchange Information **Requirements of the Appointing Party)** for the design phase of a multi-family building in Lisbon, complying with EN ISO 19650-2:2018. This is a concrete example applied to a fictitious situation and is intended as an illustration of good practice in BIM contracting during the design phase. Inherent in its nature, this is a document that will undergo various improvements over time.

3.3.1. Overall assessment

Ref.	EIR	Title	Description
N	EIR13	Preparation of the Safety and Health Plan and Health and Safety File	Delivery of the Safety and Health Plan and prepare the Health and Safety File. Information provided in accordance with the project's standards and information production methods and procedures.

Task Safety Planning

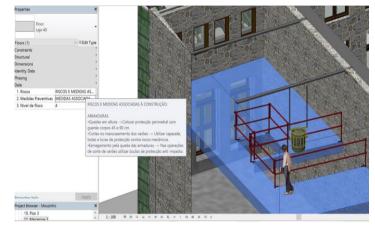

Without **BIM**

- Gap between production planning and safety planning
- Manual planning, errors are usual
- Drawings with few detail
- Planning changes are not safety changes

With **BIM**

- Detailed 3D drawings
- Less errors, more credibility better planning capacity
- Comparison between planned actual
- Temporary works can be better detailed
- Clash detection
- Planning changes are automatically safety changes

Risk Management

6D SUSTAINABILITY

PAS 1192-6:2018

Specification for collaborative sharing and use of structured Health and Safety information using BIM

Oimage courtesy of Arup and AEC3

Training

Without BIM:

- Static, passive and no-realistic training
- Language barrier
- Time constraints

With BIM:

- More agile and quick communication
- Information is always available
- No linguistic barrier

VIT

Pilot for advanced safety communication at construction site LCD display positions at site

One in the site office hall

VTT TECHNICAL RESEARCH CENTRE OF FINLAND

The other one in the staff break room

The display in the hall of the site office premises was the main display for e.g. site visitors.

The display in the staff break room was the main display for site personnel.

Exploitation of BIM-based information displays for construction site safety communication (2011)

VTT Technical Research Centre of Finland & Finnish Institute of Occupational Health The target

Collective Protection

Without BIM:

- Not well readable
- Clash between elements
- Omission of zones

With **BIM**:

- Better vizualization
- Where and when it is needed
- Clash management

BIM-based falling prevention planning in Pilot 1,

(underground floors: form work and related safety equipment)

BIM-based falling prevention planning

Emergency Planning

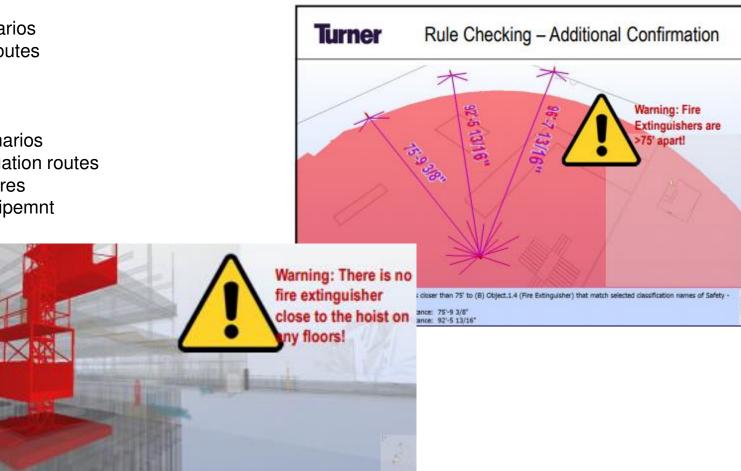

Without BIM:

- Unrealistic scenarios
- 2D evacuation routes

With BIM:

- Emergency scenarios
- Automatic evacuation routes
- Rescue procedures
- Fire-fighting equipemnt

4×3 · 西田田田 田口

BIM4OSH Observatory

BIM for Occupational Safety and Health in Architecture, Engineering, Construction and Operation Sector

□ Architecture, Engineering, Construction, and Operations (AECO) sector has a high accident rate

□ Current way of managing OSH needs to be improved

□ BIM does not yet have the prominence in OSH it has in other specialities

□ No systemized approach to the collection or of lessons learned or good practices

□ Lack of statistical-based instruments/databases covering trends and the progress of BIM for OSH implementation in different projects

□ Safety as BIM "8th dimension"

CURRENT POSITION

Aspects of BIM That Improve Site Safety

(According to Respondents Who Find That BIM Improves Site Safety)

Dodge Data & Analytics, 2017

Use in Identifying Potential Site Hazards Before Construction Begins

STEVEN NAYLOR HSE SCIENCE DIVISION

Delivering improvements in Construction project health and safety performance through innovation with data – Lessons learned from HSE's Discovering Safety Research Programme

APS & ISHCCO Joint International Congress 2025

Steven Naylor HSE Science and Research Centre Risk and Analysis team

DISCOVERING SAFETY

Presentation plan

- Overview of the health and safety challenges facing the construction industry
- Introduction to HSE's Discovering Safety International Research Programme as a vehicle for delivering change
- How this is being achieved?
- Deeper dive into some of the specific project work on Discovering Safety and outputs
- Next steps for the Programme and a call to get involved

Current health and safety risk burden in GB, based on latest HSE published construction statistics

In 2023/24, across the construction sector in GB -

- □ <u>78,000</u> workers suffered from work related ill-health
- □ <u>47,000</u> workers sustained a non-fatal injuries at work
- □ <u>51</u> workers sustained a fatal injury at work
- £1.4 billion, estimated annual cost of work-related injury and ill-health to UK society (incl. costs to state, employers and individual costs), 2021/22 estimate, 95% confidence interval, £1,054M – £1,838M

 \mathbf{Q}

HSE

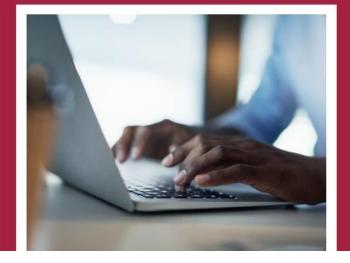

Construction statistics in Great Britain, 2024

Data up to March 2024 Annual statistics Published 20 November 2024

PROTECTING PEOPLE

AND PLACES FOR

and internationally

According to latest International Labor Organisation statistics –

- nearly 3 million people died of workrelated accidents and diseases (in 2019)
- most of the deaths caused by occupational diseases (89%)
- 11% from work related injuries
- 395 million workers sustained serious non-fatal work injuries

Safety in numbers: what labour inspection data tells us – ILOSTAT; wcms 903140.pdf

HSE's Discovering Safety Research Programme – Key delivery partners

DISCOVERING SAFETY

Delivering health and safety benefits through a data driven global community

Discovering Safety aspires to be a leader in innovative, data driven health and safety with the aim of improving performance through the use of cutting edge data and analytical techniques £10 million international research programme, started in 2018

- Funded by Lloyd's Register Foundation
- Delivered in collaboration with a range of research partners
- Construction industry focussed
- Work centred around three industry endorsed use case projects

The University of Manchester

wood.

C AtkinsRéalis

HSE's Discovering Safety Research Programme – Select contributors

AND PLACES FOR 50 HSE

DISCOVERING SAFETY Delivering health and safety benefits through a data driven global community

Discovering Safety aspires to be a leader in innovative, data driven health and safety with the aim of improving performance through the use of cutting edge data and analytical techniques

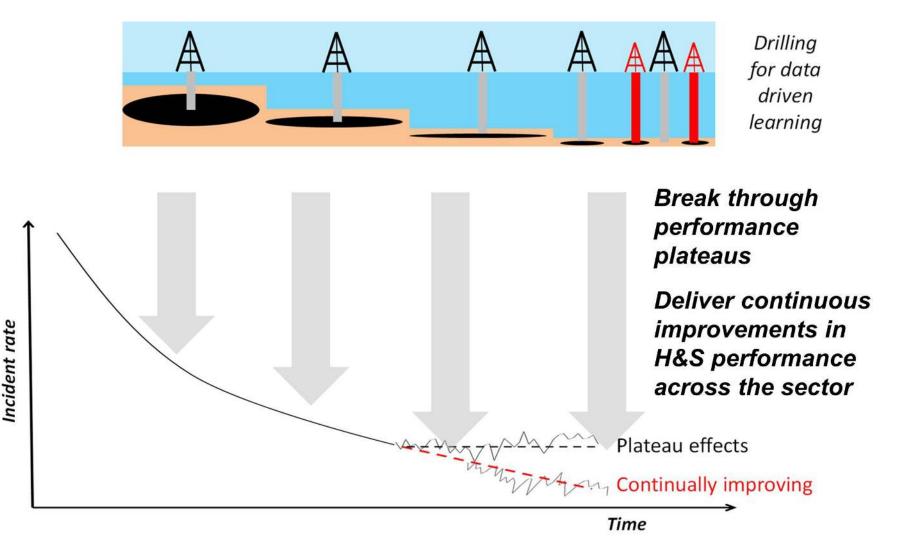

Aims of the programme at a high level

"The more you improve, the harder it gets to improve more"

"Easy wins have been made"

"If you always do what you've always done, you'll always get what you've always got"

Achieved by ...

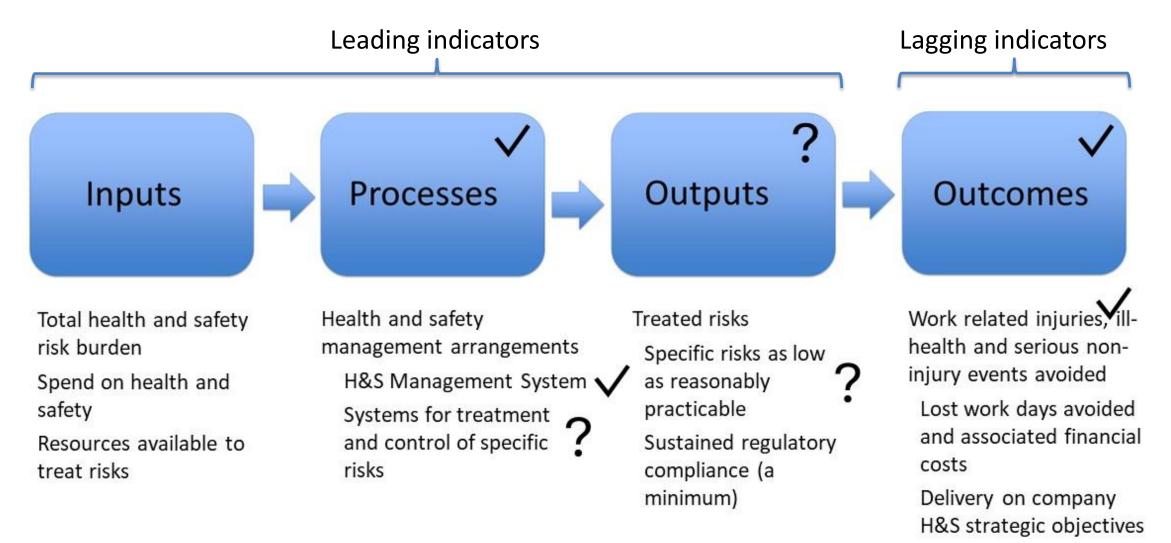

- Supporting better, more holistic measurement of project health and safety performance
- leveraging project datasets better and emerging digital technologies
- considering whole project lifecycle (design, planning, construction, and into operation of assets)
- supporting clients, designers and contractors, in meeting regulatory responsibilities, under CDM regulations (in GB)
- support in treating "foreseeable health and safety risks" (prioritising eliminating/reducing risks in design, over controlling/informing about in construction phase)

AND PLACES FOR 50 HSE

Measurement of health and safety performance – What projects are good at and less good at?

PROTECTING PEOPLE

AND PLACES FOR

YEARS

Common indicators routinely tracked by projects

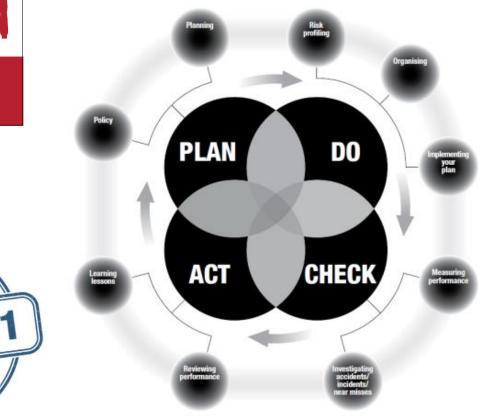

- Lost time injury rates
- Near miss reporting
- Scheduling and carrying out of inspections, audits and investigations
- Corrective action closeout
- Carrying out of senior leadership team site tours
- Carrying out of prejob safety briefings and toolbox talks as scheduled
- Review and sign-off of risk assessments and method statements
- Delivery of health and safety focused training and instruction

AND PLACES FOR 50 HSE

 Over focus on "Check" and limited elements of "Do"

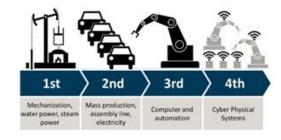

Why measuring health and safety performance is difficult, Opportunities to do it better

- Health and safety is very documents based, information recorded as free-text in reports, in spreadsheets
- Easy to track reactive and active monitoring is happening, less easy to enumerate around findings

- Large language models, Gen AI, to understand meaning in free text reports
- Computer vision, wireless sensors on plant & people, to track location of workers relative to site hazards, near/real time
- Drones, robotic & autonomous systems, to remove humans from risk loops
- Machine readable requirements, site diaries, inspection/audit reports, enabling smart (auto) compliance checking

Digitally enhanced safety by design, prevention through design

- ISO 19650/6 health and safety information management through BIM standard, NBS Uniclass health and safety risk classification
- Design risk readiness framework
- Assurance of digital rehearsal & high-risk revie processes
- Developing predictive analytic capabilities
- Design risk treatment database

UNIFIED CONSTRUCTION CLASSIFICATION

Uniclass is made up of a set of tables that can be used by different parts of the construction industry in various ways.

ALFREDO SOEIRO UNIVERSITY OF PORTO

Illustrating Safety and Health Construction Coordination Effective Costs of Prevention Project Case Study

Alfredo Soeiro ISHCCO Vice President APS ISHCCO Congress 14Mar25

- Case Study
- Types of Costs (general)
- Impact (gravity, probability, exposure)
- Real Costs
- Decision making process (AI?)
- What to do?

- Jorge Granja, adjunct CM
- Road Tunnel Renovation
- About 800k Euros
- 10 months

- No bill of quantities, no costs specified, no specifications
- Just a sum of 2500 Euros for Health and Safety!

Туреs of costs

- Construction site (fence, lights, signals, etc.)
- Scaffolding temporary works
- Individual equipment (boots, masks, gloves,...)
- Fall prevention (rails, nets, straps, ...)
- Coordination design (project, planning, meetings,
- Coordination operation (inspections, meetings, training, ...)

Indicative values

- Construction yard - 4,144€

- Collective equipment 12,340€
- Individual equipment 3,670€

- Coordination design, management and supervision 20,046
- Total cost construction 780,392€
 Cost prevention 40,200€ (5,15%) >> 2,500€

Percentage of costs

- ECORYS study for SMEs
- ISHCCO partner of study
- Prevention costs less than accidents
- Finland 12%
- UK 8%

ISHCCO

- Netherlands 6%
- Italy 5%
- Portugal 2%

Probability, Impact, Exposure, Cost

- Can not invoice prevention costs

- Data from previous accidents
- Associate task plan with risk (R)

- Define impact, seriousness integer scale
 (I)
- Exposure in days (D)
- Cost of prevention measures for each task (C)
- Calculate and register for the whole duration of construction

How to manage budget

- Three methods for decision making
 - Rationality (Bernoulli)
 - All risks, R, are treated equally
 - Large budget
- Utility Criterion

ISHCCO

- Order by task cost, C, or by impact, I
- Decision Tree
 - Combine probability P, impact, I, exposure, D and cost, C

- Rational (Bernoulli)
 - Concreting a beam
 - Risks: fall or oil contamination: P ,I and C are very different
- Utility
 - Trench failure
 - Lack of struts (58%) and insufficient support (11%)

Катария (cont.)

Decision tree Fatal accidents $P * C * E = 6,215 \in$ Non fatal accidents $P * C * E = 169,850 \in$ Impact

Fatal I = 100,000 - 621,500Nonfatal I = 1 - 169,850

Conclusions

- Consider P, I, E, C

- Analyse tasks for all construction
- Obtain DATA

ISHCO

- Effectiveness of spending
- Use AI and ML
- Simulate execution associated with risks
- Use funds and time wisely
- Do not accept to coordinate without
 - proper funding for prevention!

A station of the stat

PHILP BAKER ISHCOWGCHAIR

SHCC AND SUSTAINABILITY

Philip Baker Working Group Chair

- The SHCC is not the sustainability consultant
- SHCCs have their own specific skills
 - See IQF <u>ISHCCO Qualification Framework ISHCCO -</u> <u>International Safety and Health Construction Coordinators</u> <u>Organization</u>
- However the SHCC must engage in helping to reduce harm to the climate.

- Seven Golden Rules
 - 1. Take leadership demonstrate commitment
 - 2. Identify hazards control risks
 - 3. Define targets develop programmes
 - 4. Ensure a safe and healthy system be well-organized
 - 5. Ensure safety and health in machines, equipment and workplaces
 - 6. Improve qualifications develop competence
 - 7. Invest in people motivate by participation.

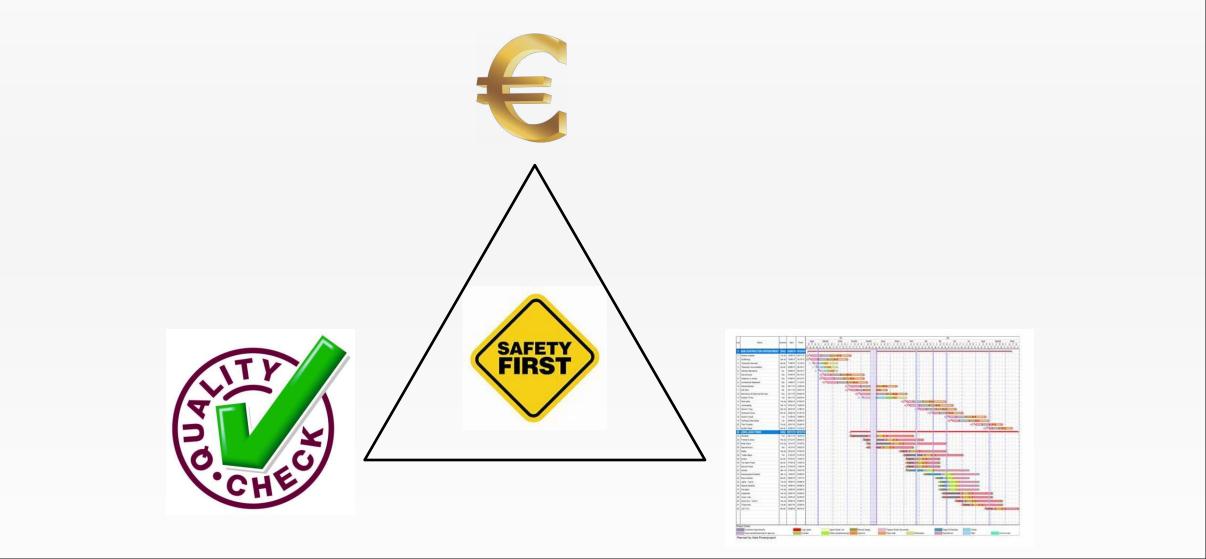

- The fundamentals of sustainability need to be understood by all SHCCs
- Need to be able to articulate and evidence these in work.
